# Native Habitats Tasman Ecological Assessment Report

Site: MU 375 Dominion Creek

Landowners/Occupiers: TDC

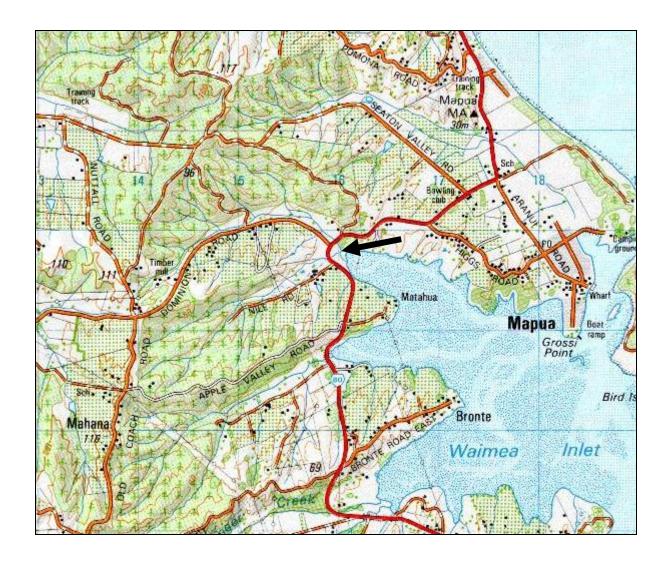

**Ecological District:** Moutere

**Grid Ref:** E2516010 N5994830

Surveyed By: Mike Hickford & inanga survey volunteers

**Date:** 16 April 2012

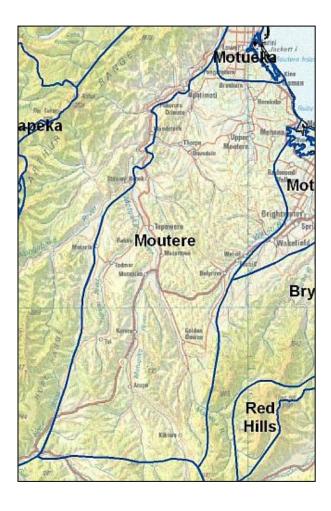

Survey Time: ½ hr

# THE SETTING – MOUTERE ECOLOGICAL DISTRICT (ED)

## **Location and Physical Description**

The Moutere Ecological District occupies most of the Moutere Depression. It is rolling hill country founded on deeply weathered fluvio-glacial outwash gravels (Moutere Gravels), with a little limestone and granite in the west. The hills are drained by numerous valleys with flat alluvial floors. There is a small amount of coast containing an estuarine shore and a series of bluffs. The climate is sunny and sheltered, with very warm summers and mild winters. Most of the land is in private ownership and is used for pastoral farming, forestry, horticulture and small-scale settlement. Tasman District Council has considerable landholdings in this District.

## **Ecosystem Types Originally Present**

Formerly, the Ecological District, apart from the waterways, would have been almost entirely covered in forest. The alluvial valley floors supported towering podocarp forests of totara, matai, rimu, miro and kahikatea. On the hills, black beech was dominant at the seaward end of the District, with hard beech prominent further inland, giving way further inland still to red beech with silver beech. In sheltered coastal gullies were pockets of lush broadleaved forest containing tawa, titoki, pukatea, nikau and tree ferns. Along the coastal bluffs was forest of ngaio, titoki, nikau and other broadleaved trees, with totara and black beech. Fringing the estuary would have been a vegetation sequence like that in the neighbouring Motueka Ecological District. Freshwater

wetlands occurred in the coastal valleys and would have included fertile lowland swamps with kahikatea, harakeke, cabbage tree and tussock sedge (*Carex secta*). Rivers and streams, including riparian ecosystems (trees, shrubs, flaxes, toetoe, etc) and some braided river beds, would have made up an appreciable although not large portion of the District. The table below gives estimates of the extent of these original ecosystems.

#### **Existing Ecosystems**

Most of the natural terrestrial ecosystems have been lost. What remains is largely a scattering of fragments of beech forest, with some larger areas in the south. There are tiny remnants of coastal bluff forest, lowland broadleaved forest and podocarp forest only, and a few wee freshwater wetlands. The estuary margin is still surprisingly intact, although its fringing vegetation sequence has largely gone. The table below gives estimates of the proportions of the original ecosystems that remain.

#### **Degree of Protection**

There is little protected land within the Ecological District. However, there are significant remnants protected in reserves and covenants. These include a coastal bluff forest remnant at Ruby Bay, tawa forest at Eves Valley, podocarp forest remnants near Upper Moutere, several key remnants of beech forest and larger tracts of beech forest in the south. A few tiny wetlands are also protected. The table below gives estimates of how much of the original and remaining ecosystems have formal protection.

Indigenous Ecosystems – Moutere Ecological District				
Ecosystem type	Original extent (% of ED)	Proportion of original extent remaining (%)		of original naining area
			Original	Remaining
Coastal sand dune and flat	_	_	_	_
Estuarine wetland	<1	30	?	?
Fertile lowland swamp and pond	1	<5	<2	<20
Infertile peat bog	_		_	_
Upland tarn	<del></del>	_	_	_
Lake	<u> </u>		_	<b> </b>
River, stream and riparian	1	40	?	?
Lowland podocarp forest	20	1	<1	50
Lowland broadleaved forest	1	<5	<5	100
Lowland mixed forest	5	<5	<5	50
Lowland beech forest	65	5	2	40
Upland beech forest	5	50	40	80
Subalpine forest	<u> </u>		_	l —
Lowland shrubland	<1	<5	<1	<10
Upland/subalpine shrubland	-	<del>-</del>	<b> </b> —	<b> </b> —
Frost flat communities	<del>-</del>	<u> </u>	<b> </b> —	<b> </b> —
Tussock grassland	-	<del>-</del>	<b> </b> —	<b> </b> —
Alpine herbfield and fellfield	-	<del>-</del>	<b> </b> —	<b> </b> —

#### SITE DESCRIPTION

#### Location, Geology, Hydrology

The site is located on the true left bank of Dominion Stream, just upstream of its mouth with the Waimea Inlet, and 60m downstream from the SH60 crossing. The location is the most NW corner of the Waimea Inlet near to Mapua.

#### **Habitat**

The site comprises tall fesue growing on a steep riparian bank, extending for up to 5m along the streambank.

#### **Fauna**

A small inanga spawning area totalling 1m<sup>2</sup> was found with low-moderate egg densities (300 eggs/100cm<sup>2</sup>.

#### **Weed and Animal Pests**

N/A

#### **Other Threats**

None were noted.

#### **General Condition & Other Comments**

The site appears stable.

#### Landscape/Historic Values

N/a

## ASSESSMENT OF ECOLOGICAL SIGNIFICANCE

The following criteria are assessed:

**Representativeness:** How representative is the site of the original vegetation? How representative is the site of what remains?

**Rarity and Distinctiveness**: Are there rare species or communities? Are there any features that make the site stand out locally, regionally or nationally for reasons not otherwise addressed?

**Diversity and Pattern**: Is there a notable range of species and habitats? To what degree is there complexity in this ie patterns and gradients?

Size/shape: How large and compact is the site?

**Ecological context**: How well connected is the site to other natural areas, to what extent does the site buffer and is buffered by adjoining areas, and what critical resources to mobile species does it provide?

Sustainability: How well is the site able to sustain itself without intervention?

## Site Significance

The technical assessment of significance is tabled in the Appendix.

This site is not significant for the following reasons:

Although the site is not of 'significance' in the context of the entire ecological district due to its very small size it is nevertheless of local note, and worthy of nurturing. To date only five spawning sites are known in the ecological district (survey incomplete).

#### **Management Issues and Suggestions**

It is important in any native vegetation restoration of this TDC reserve that sufficient light is retained to favour the tall fescue that constitutes the preferred spawning site.

#### **APPENDIX**

## **Technical Assessment of Site Significance**

Each site is ranked according to the highest ranking vegetation community or habitat that occurs within it. However, a site will be divided into more than one area for assessment purposes if they vary markedly in character, size or condition. Some examples are:

- (a) a core area of vegetation (say, a podocarp gully remnant) is surrounded by/adjoins a much larger area of markedly different vegetation (say, kanuka scrub);
- (b) a core area of vegetation has *markedly* different ecological values to the surrounding/adjacent vegetation;
- (c) where artificially abrupt ecological boundaries occur between an area of primary vegetation and a surrounding/adjacent area of secondary vegetation that is more than just a change in canopy composition.

The above does not apply if such adjoining vegetation forms only a small part of the total site, or if such vegetation forms a critical buffer to the core area.

Where such division of a site into two or more separately assessed areas occurs, such adjoining areas will also be considered in their buffering/connectivity roles to one another.

Note that the secondary and additional criteria cannot feasibly be scored as the habitat comprises weeds, and the fauna are highly mobile over their life cycle.

Significance Evaluation			
	Score	Example/Explanation	
Primary Criteria			
Representativeness			
	L		
Rarity and Distinctiveness			
A locally important breeding,	М	A small spawning site for inanga in the context of	
roosting or foraging site for an		the eeological district	
indigenous animal specie

NB where scores are averaged, the score must reach or exceed a particular score for it to apply

Summary of Scores	Criterion	Ecological District Ranking
Primary Criteria	Representativeness Rarity and Distinctiveness Diversity and Pattern	L M L
Secondary Criteria	Ecological Context Size and Shape	
Additional Criteria	Sustainability	

 $H = High \quad MH = Medium-High \quad M = Medium \quad ML = Medium-Low \quad L = Low$ 

## **Summation of Scores to Determine Significance**

If a site scores at least as highly as the combinations of primary and secondary scores set out below, it is deemed significant for the purposes of this assessment.

Primary Criteria		Secondary Criteria
of the three primary criteria with a score at as high as listed	Any of the two secondary criteria with a score at least as high as listed	
	Plus	
Н		<del></del>
MH x 2		_
MH + M		_
MH	+	MH
M x 2	+	Н
M x 2	+	MH x 2
M	+	H + MH

H = High MH = Medium-High M = Medium

Is this site significant under the TDC assessment criteria? NO

#### **Species List**

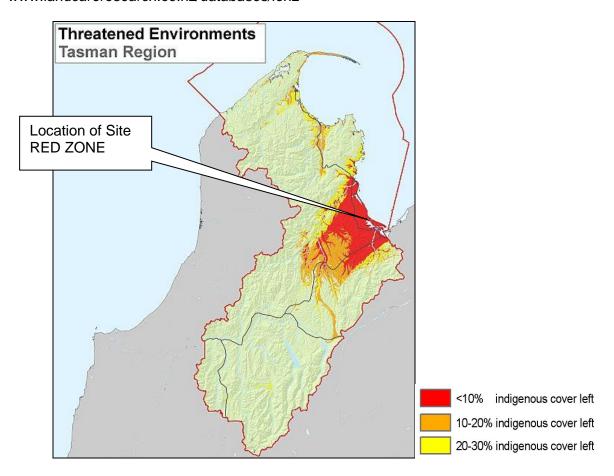

r = Rare o = Occasional m = Moderate Numbers ml = Moderate Numbers Locally c = Common lc= Locally Common f = Frequent lf = Locally Frequent x = Present But Abundance Not Noted P = Planted R = Reported v= Very. For example: vlc = very locally common, mvl = moderate numbers very locally

## Land Environments of New Zealand (LENZ)

LENZ is a national classification system based on combinations of soil characteristics, climate and landform. These three factors combined are correlated to the distribution of native ecosystems and species.

When LENZ is coupled with vegetation cover information it is possible to identify those parts of the country (and those Land Environments) which have lost most of their indigenous cover. These tend to be fertile, flatter areas in coastal and lowland zones as shown in the map below for Tasman District.

Further information on the LENZ framework can be found atwww.landcareresearch.co.nz/databases/lenz

#### **National Priorities for Protecting Biodiversity on Private Land**

Four national priorities for biodiversity protection were set in 2007 by the Ministry for the Environment and Department of Conservation.

National Priorities	Does this Site Qualify?
1 Indigenous vegetation associated	Yes
with land environments (ie LENZ) that	
have 20 percent or less remaining in	
indigenous cover. This includes those	
areas colored in red and orange on the	
map above.	
2 Indigenous vegetation associated	No
with sand dunes and wetlands;	
ecosystem types that have become	
uncommon due to human activity	
3 Indigenous vegetation associated	No
with 'naturally rare' terrestrial	
ecosystem types not already covered	
by priorities 1 and 2 (eg limestone	
scree, coastal rock stacks)	
4 Habitats of nationally 'threatened' or	No
'at risk, declining' indigenous species	

Further information can be found at -

www.biodiversity.govt.nz/pdfs/protecting-our-places-brochure.pdf

## Significance of LENZ and National Priorities

What does it mean if your site falls within the highly depleted LENZ environments, or falls within one or more of the four National Priorities?

These frameworks have been included in this report to put deeper ecological context to the site. They are simply another means of gauging ecological value. This information is useful in assessing the relative value of sites within Tasman District when prioritising funding assistance. They otherwise have no immediate consequence for the landowner unless the area of indigeneous vegetation is intended to be cleared, in which case this information would be part of the bigger picture of value that the consenting authority would have to take into account if a consent was required.
